E. Read the following facts about the human circulatory system and answer the questions.

The circulatory system consists of the heart, blood vessels, and blood. The heart is a muscular organ that acts like a pump. Blood vessels are hollow tubes that carry blood throughout the body. Veins are thinner and most of them carry carbon-dioxide-rich blood. Arteries are thick and most of them carry oxygen-rich blood. Capillaries are the thinnest and they connect veins and arteries. Blood carries useful materials like nutrients and oxygen to different body parts. Blood also collects carbon dioxide and urea from different body parts and transports them for removal. The blood circulation speeds up when the body needs more oxygen. This happens when we do physical activities. Eating a balanced diet and physical exercises keep the heart healthy.
